cash-in-transit, security
and bullion vehicles

Taxi drivers are increasingly coming under attack from passengers.

Whether it's aggression from drugs or too much alcohol, a passenger who doesn't intend to pay the fare, or someone intent on robbing the day's takings the outcome is all-too-often serious.

Female taxi drivers are even more at risk from those who consider them an easy target.

But the truth is these people are often cowards who will back off as soon as they are challenged.

At the push of a button the Taxi Alarm calls for help and its real human voice cannot be ignored by anyone within earshot.

An optional electronic sounder inside the vehicle serves to confuse and disorientate the assailant who will usually cease the attack and leave as quickly as possible.

When it's your safety at stake you need to respond immediately. Your assailant won't be expecting an alarm to sound and when it does he will be the one who's afraid of the consequences.

TAXI ALARM by O.W.L. the experts in electronic vehicle attack systems

The Taxi Alarm is available as a single unit talking alarm with an attention-grabbing siren, or with an extra speaker to give even louder volume.

An optional ear-splitting electronic sounder may also be fitted inside the vehicle. This will deter even the most aggressive attacker.

Installation is simple. The talking sounder is mounted in a convenient location under the bonnet, behind the radiator grille or front bumper - it's fully waterproof.

A single wire runs from the battery to a switch inside the vehicle and from the switch to the alarm sounder.

You can use a standard on/off switch that matches the existing switches or a panic button available separately.

To trigger the alarm simply operate the switch or panic button.

Immediately a loud siren sounds outside the vehicle followed by a male or female voice which shouts...

"Help...Taxi Driver under attack...please call the police"

The siren and message continue to sound until you reset the alarm. It is guaranteed to attract the attention of anyone within earshot - and that's the last thing an attacker will want to do.

Also available is a second message to sound only inside the vehicle when each journey begins...

"For security purposes all passengers in this vehicle are recorded by cctv"

This is an extremely effective deterrent which can prevent potential incidents before they begin. It's much better than a simple sign even if you don't have cctv installed.

TALKING ATTACK ALARM

Main alarm unit fits under bonnet or behind front grille

Optional second speaker behind rear bumper for even louder sound output

Optional electronic "sound bomb" to fit in passenger compartment
